

VU-ANH LE

AI Investment Research and Technical Due Diligence

Generative AI • Deep-Domain Technologies • Scientific Computing • Startup Evaluation

mcu7uh@virginia.edu • Website • LinkedIn • Google Scholar • ORCID

PROFESSIONAL SUMMARY

Computer Science Ph.D. student and quantitative researcher with experience analyzing artificial intelligence and scientific technologies. Skilled at evaluating technical claims, testing underlying assumptions, comparing competing approaches, identifying execution and deployment risks, and translating complex evidence into concise recommendations. Particularly interested in early-stage GenAI companies applying foundation models and building support infrastructure to scientific, industrial, and other technically demanding domains.

CORE COMPETENCIES

Analytics: technology and market research, startup landscape mapping, competitive benchmarking, founder and technical-team question development, evidence synthesis, investment-memo writing, and risk identification.

Technical Due Diligence: technical feasibility assessment, architecture and methodology review, experimental validation, performance benchmarking, failure-mode analysis, scalability assessment, and scrutiny of scientific assumptions.

GenAI and Deep Domains: large language models, generative systems, trustworthy AI evaluation, scientific machine learning, environmental informatics, nuclear-environmental risk, and data-intensive scientific applications.

Research and Analytics: Python, PyTorch, scikit-learn, NumPy, pandas, statistical analysis, regression modeling, experimental design, data visualization, Git, and LaTeX.

SELECTED EXPERIENCE

Vietnam Academy of Science and Technology

Hanoi, Vietnam

Researcher & Technical Consultant, Institute of Information Technology

May 2025 – May 2026

- Investigated reliability, robustness, and hidden failure modes in generative AI systems, developing expertise relevant to evaluating whether startup performance claims are technically credible and deployment-ready.
- Co-developed **Residual-Noise Fingerprinting (RN-F)**, a lightweight method for detecting possible training-data contamination in language models; evaluated the method across multiple model and data settings and compared it with competing approaches.
- Contributed to experimental design, statistical analysis, baseline selection, limitation analysis, and technical writing for a research paper published at an ICML 2025 (#2 AI publication venue) workshop: <https://icml.cc/virtual/2025/51024>.
- Provided technical reports for policy drafts and technical solutions of national projects to senior managers.

Massachusetts Institute of Technology

Cambridge, Massachusetts

Summer Research Intern, Department of Nuclear Science and Engineering

June 2024 – August 2024

- Developed quantitative models and extended the open-source `pylenm` environmental informatics package to support decision-making for a nuclear-waste disposal site: <https://pypi.org/project/pylenm>.
- Evaluated alternative modeling approaches, interrogated assumptions, and identified data and reliability limitations that could produce misleading conclusions in a high-stakes scientific environment.
- Translated technical results into recommendations on prediction reliability, environmental risk, and appropriate use of the models by interdisciplinary stakeholders.
- Presented findings to researchers and program stakeholders, demonstrating the ability to communicate complex technologies clearly to non-specialist audiences: <https://oge.mit.edu/msrp/profiles/vu-anh-le>.

EDUCATION

University of Virginia

Charlottesville, Virginia

Doctor of Philosophy in Computer Science, UVA Computer Science Scholar

Beginning August 2026

Research direction: theoretical machine learning and AI for scientific systems, with emphasis on reliability, constrained learning, and technically rigorous evaluation of advanced AI models.

Beloit College

Beloit, Wisconsin

Bachelor of Science in Mathematics, Cum Laude

August 2021 – May 2025

Selected training: mathematical statistics, algorithm design and analysis, data mining, differential equations, complex analysis, topology, experimental design, and quantitative modeling.

Recognition: Presidential Scholarship; Board of Trustees Grant; Dean's List every semester.
